

The chart displays the daily number of COVID-19 cases in the United States from 2013 to 2024. The x-axis represents the year, and the y-axis represents the number of cases. The data is presented as a series of lines, with the most significant series being a purple line that shows a massive surge starting in early 2020, reaching a peak of over 100,000 cases in early 2022, and then fluctuating at high levels through 2024. Other series, including blue, green, and red lines, show much lower case counts, with some peaking in 2018 and others showing more stable trends throughout the period.
